Creating Web Service

Friday, October 13, 2017

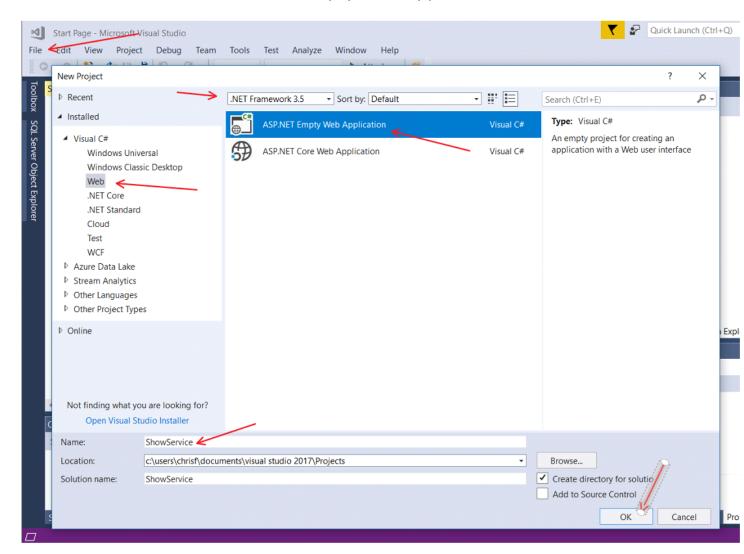

9:09 PM

Quick Steps

- 1. Create a new empty Asp.NET Web Application.
- 2. In Solution Explorer right-click on the project root.
- 3. Choose the menu item Add-> Web Service

 $From < \underline{https://stackoverflow.com/questions/12051814/how-to-create-web-service-server-client-in-visual-studio-2012} > \underline{https://stackoverflow.com/questions/12051814/how-to-create-web-server-client-in-visual-studio-2012} > \underline{https://stackoverflow.com/questions/12051814/how-to-create-web-server-client-in-visual-studio-2012} > \underline{https://stackoverflow.com/questions/12051814/how-to-create-web-server-client-in-visual-studio-2012} > \underline{https://stackoverflow.com/questions/12051814/how-to-create-web-server-client-in-visual-studio-2012} > \underline{https://stackoverflow.com/questions/12051814/how-to-create-web-server-client-in-visual-studio-2012} > \underline{https://stackoverflow.com/questions/12051814/how-to-create-web-server-client-in-visual-studio-2012} > \underline{https://stackoverflow.com/questions/12051814/how-to-create-web-serv$

Start Visual Studio and select: File | New | Project Choose .NET Framework 3.5 (not required but helpful) Choose Web and select ASP.NET Empty Web App

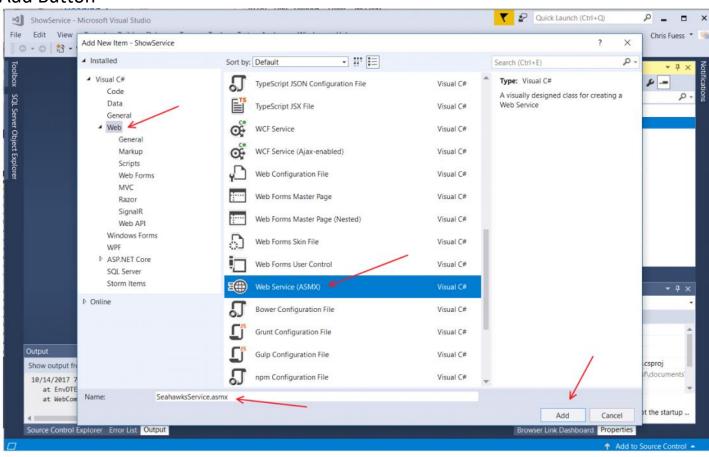

In Solution Explorer right-click on the Project root. Choose Add | New

Item

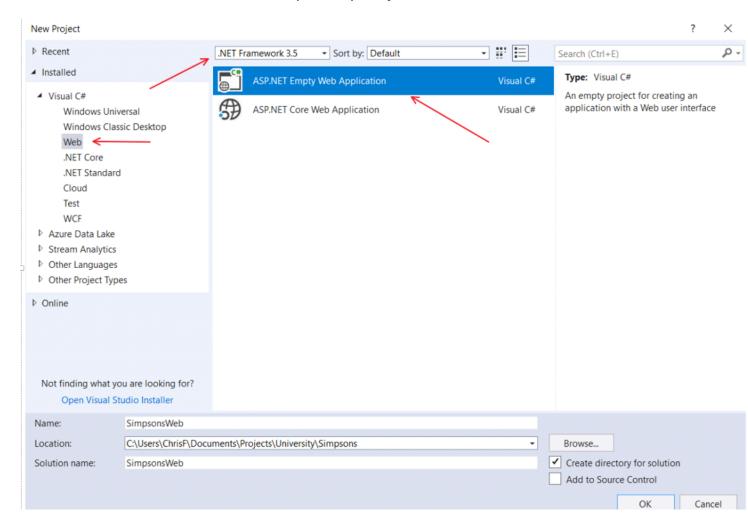

Choose Web then Scroll down to Web Service (ASMX) then click the Add Button

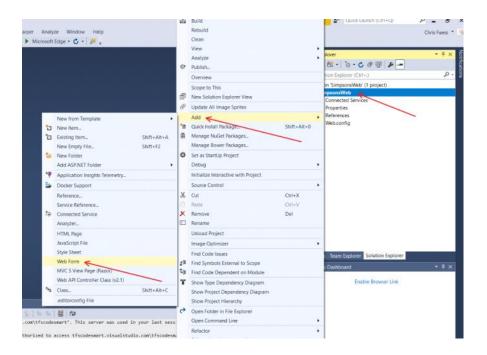

Creating Web Service Client

Friday, October 13, 2017 10:37 PM

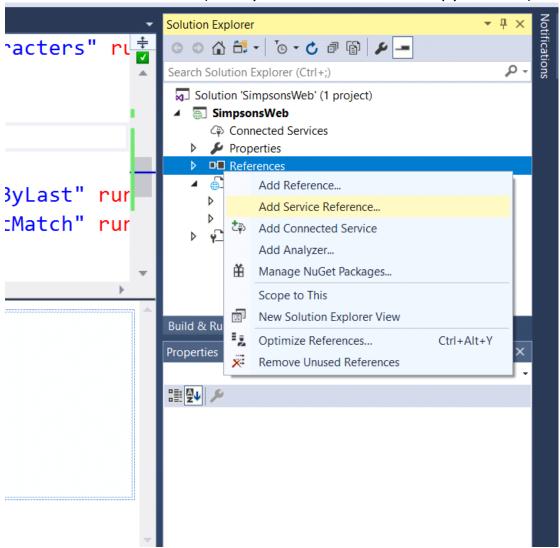

Start Visual Studio and select: File | New | Project

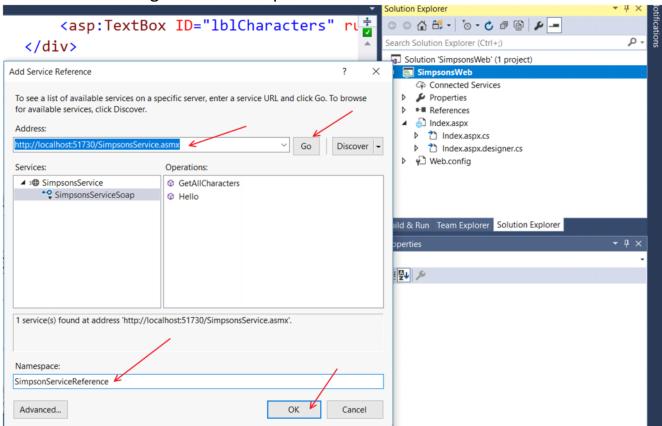

Right-Click the web project and add a new Web Form, call it index and it will make a index.aspx page.

Add a Service Reference (Start your service first and copy the URL)

Enter the URL and give the Namespace a name and click OK

Class notes

Saturday, October 14, 2017 7:38 AM

- Web services provide a way to interact with programming objects located on remote computers.
- Web services are based on standard technologies and are interoperable.

Key technologies:

- Hypertext Transmission Protocol (HTTP)
- Extensible Markup Language (XML)
- Simple Object Access Protocol (SOAP)
- Web Services Description Language (WSDL)

- SOAP stands for *Simple Object Access Protocol*.
- SOAP is the protocol that defines how remote computers exchange messages as part of a Web service communication.
- Message format: XML
- XML is easier for otherwise non compatible systems to understand.
- Message transmission: HTTP
- HTTP, they can normally reach any machine on the Internet without being blocked by firewalls.

WSDL

Saturday, October 14, 2017 8:09 AM

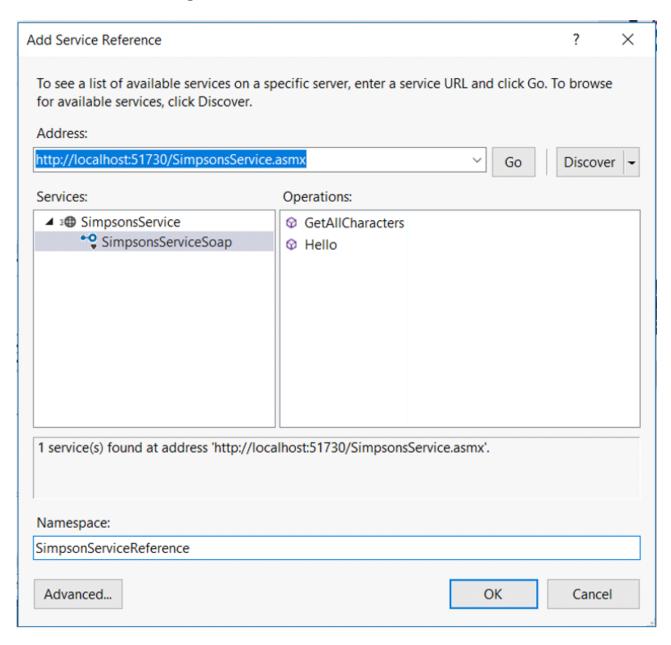

- WSDL stands for **Web Services Description Language**.
- A WSDL file acts as the public interface of a Web service and includes the following information:
- The data types it can process
- The methods it exposes
- The URLs through which those methods can be accessed

8:10 AM

- Saturday, October 14, 2017
 - Inherit from System.Web.Services.WebService
 - Mark the class with a WebService attribute
 - Mark the methods with WebMethod attribute

```
[WebService(Namespace = "http://northwindtraders.com/")]
[WebServiceBinding(ConformsTo= WsiProfiles.BasicProfile1_1)]
public class TextWebService : System.Web.Services.WebService
{
   [WebMethod]
   public string ToUpper(string inputString)
   {
     return inputString.ToUpper();
   }
}
```

 Add a reference to the Web service by using the Add Service Reference dialog Box.

The proxy object allows you to invoke Web service methods.

```
protected void Button1_Click(object sender, EventArgs e)
{
   var webService_service = new TextServiceSoapClient();
   toLowerLabel.Text = webService.ToLower(TextBox1.Text);
   toUpperLabel.Text = webService.ToUpper(TextBox1.Text);
}
```
